	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Menu fetcher to fetch menu items from the purdue website ● User able to input their specific food constraints ● Filter the food items based on user constraints	**Schedule - (For V2.0+)** ● Allow users to select multiple food items to calculate totals ● Filter menu by dietary preferences ● Picking a specific dining hall
Not Important	**Delegate - (Use a library)** ● Java httpclient library ● Connecting to dining hall site ● Getting specific food item data from the site and using it to calculate for the user	**Delete - (Cut it)** ● Making it a website/mobile app ● Save user profile and tracking eating history ● Finding food suggestions to suggest to the user

Tech Stack:

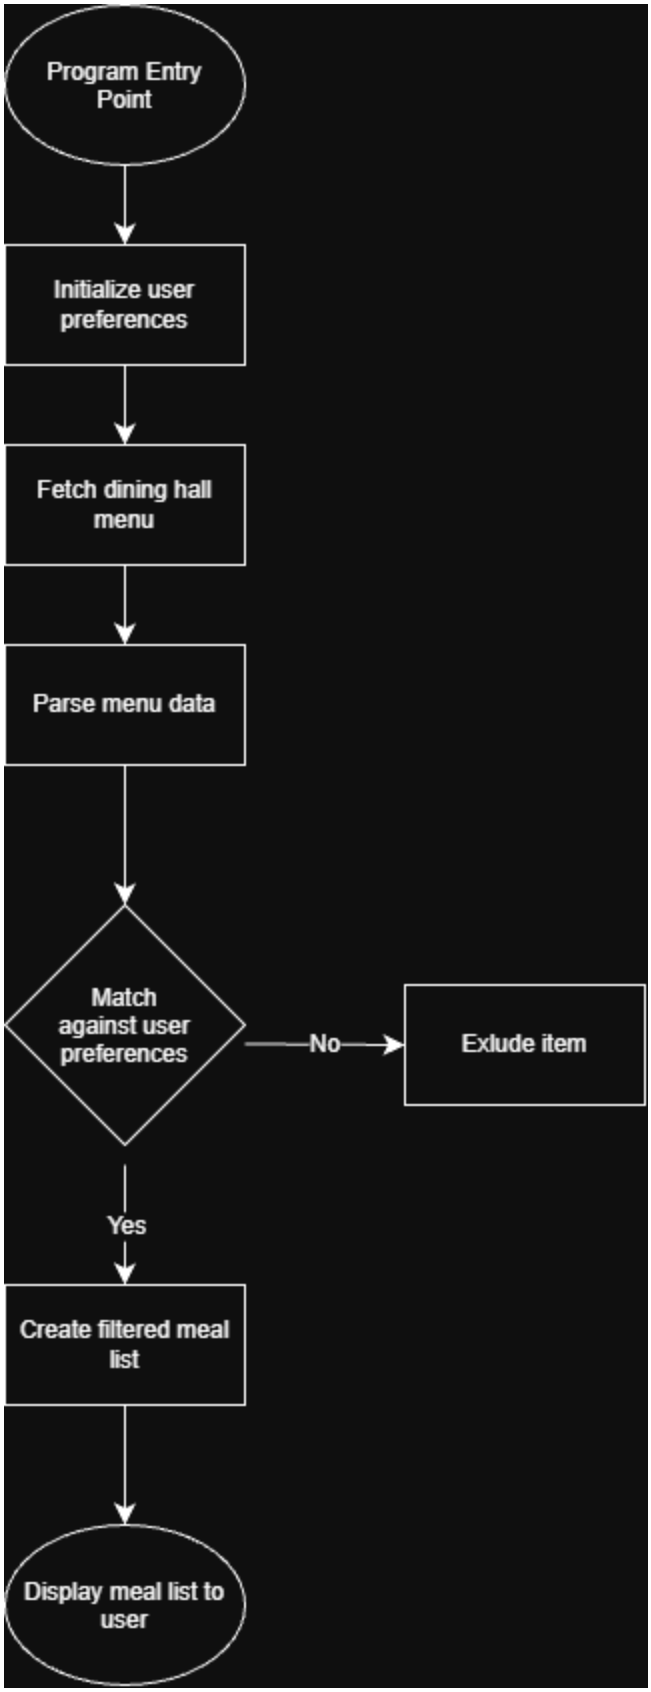

Programming Language: Java
Libraries, packages, external tools:

- Java HttpClient to make requisitions and fetch data from the Purdue dining website
- HTML parsing library like Gson or Jackson to parse the responses from the dining hall website and extract specific food item details.

Data storage: plain text files (.json or .csv)
External data source: Purdue dining court menus web page. Data is accessed using java's httpclient.

Chunked Build Plan:

1. Set up Git repository and Java project structure
2. Use HttpClient to fetch content from the Purdue dining court website
3. Extract food date by implementing Html menu parser
4. Get user dietary preferences
5. Write code to get foods based on user preferences
6. Display it to the user

Program Entry Point
Initialize user preferences
Fetch dining hall menu
Parse menu data
Match against user preferences
No
Exlude item
Yes
Create filtered meal list
Display meal list to user
